Annex B: CCDS description about each field

The Universal Data Element Framework (UDEF) provides a conceptual naming convention framework with associated structured unique identifiers for indexing and aligning semantically equivalent concepts. It provides a means to associate different data element names (i.e. vocabulary terms) that semantically refer to the same concept, to a standard data element concept name provided by the framework that conforms to the relevant international standard on naming conventions, ISO/IEC 11179-5. A key definition provided in paragraph 3.3.9 of ISO/IEC 11179-1 is “data element concept – concept that can be represented in the form of a data element, described independently of any particular representation.” Interpreting the meaning of data element concepts is the essential first step of enabling semantic interoperability between disparate applications.

Although CCDS is not currently adopting the very generic enterprise-wide perspective of the UDEF, but the following meta-data definitions of the CCDS elements will ensure our initial country-wide e-Governance applications interoperability. CCDS can easily adopt the UDEF at a later date for international and industry-wide interoperability when situation warrants to do so. Applying UDEF principles to the current CCDS can unnecessarily complicate its adoption and delay the CCDS implementations further.

Country codes

Country codes are short alphabetic or numeric geographical codes (geocodes) developed to represent countries and dependent areas. Several different systems have been developed to do this. The most widely used is ISO-3166-1. This standard defines for most of the countries and dependent areas in the world:

- a two letter (ISO 3166-1 alpha-2): ISO 3166-1 alpha-2 codes are two-letter country codes to represent countries and dependent territories. They are the most widely used of the country codes published by ISO:
- a three-letter (ISO 3166-1 alpha-3): ISO 3166-1 alpha-3 codes are three-letter country codes to represent countries and dependent territories. They are used in ISO/IEC 7501-1 for machine-readable passports.
- a three-digit numeric (ISO 3166-1 numeric) code: ISO 3166-1 numeric (or numeric-3) codes are 3-digit country codes to represent countries and dependent territories and correspond to the 3-digit country codes developed and maintained by the United Nations Statistics Division.
